Category:Computer-aided design software Category:Computer-aided design software for WindowsAbout the author (NewsTarget) The original Harvard study, published in The Journal of the American Medical Association, published in 1981, proposed that a radical link existed between consumption of dairy and prostate cancer. The study, which included nearly 10,000 men, was later pulled when the data was found to be faulty, likely due to a programming error. That little error apparently wasn't discovered until it was too late, and the originally flawed study was published in the New England Journal of Medicine in 1991. It later won the American Medical Association's prestigious James A. Heron Award for scientific misconduct. The Journal of the American Medical Association (JAMA) retracted the study, but instead of being ashamed of the fact that they had published a study containing flawed data, the editors simply stated that this particular study was about so little that it was of little importance. Apparently this little study was going to change the world in an important way. This study was published just three years after the original study from the Harvard group. Despite the fact that both studies used a large sample size, the new study was much more cautious in its conclusions and was not likely to change the way many doctors practice medicine, or at least that's what the JAMA editors said. This issue has been in the news lately because it seems as if the obesity epidemic has had the power of reversing a major cancer study. Although many people have noticed that the American Cancer Society has been on a mission to appear as if they had reversed their position on the consumption of meat and dairy, and it seems as if they are now on a mission to claim the study as correct. One of the authors of the new study, Dr. Frank M. Sacks, is quoted as saying, "The work of the last couple of years has put the association [of dairy and prostate cancer] back in the scientific forefront. The public health implications are enormous. This is a major message for the public." Well, if it's a major message to the public, then why has it been forgotten about by the editors of the JAMA? And, why has the American Cancer Society been unable to confirm the findings of this study? Why has the American Cancer Society and its editor refused to listen to the study's authors? Why has the editor of the JAMA refused to listen to this study? Why has the American Cancer Society (ACS) announced that it is still on its original agenda that a1d647c40b
